

Rapido Ride Booking Data Analysis Project Documentation

This project analyzes 100,000+ Rapido ride booking records using SQL and Power BI to identify revenue trends, customer behavior, ride patterns, payment preferences, and operational KPIs.

Project Objectives

- Analyze ride booking trends
- Identify revenue patterns
- Perform customer and driver analysis
- Analyze cancellation rates and surge pricing impact
- Build interactive Power BI dashboards

Tools & Technologies Used

- MySQL
- Power BI
- Excel/CSV
- GitHub

Dataset Information

- 100,000 unique ride booking records
- Contains customer, driver, fare, payment, and ride status details
- Supports KPI analysis and dashboard reporting

Important KPIs

- Total Revenue
- Total Rides
- Average Fare
- Cancellation Rate
- Average Customer Rating
- Revenue by City
- Payment Method Analysis

SQL Concepts Used

- SELECT Statements
- GROUP BY & HAVING
- Aggregate Functions
- Subqueries

- Window Functions
- Ranking Functions

Power BI Dashboard Pages

- Executive Summary
- City Analysis
- Customer Analysis
- Driver Analysis
- Payment & Surge Analysis

Business Insights

- Mumbai generated highest revenue
- UPI was the most used payment method
- Bike rides contributed highest ride volume
- Evening hours had peak bookings

Metric	Description
Total Revenue	Sum of Final Fare from all rides
Cancellation Rate	Percentage of cancelled rides
Average Fare	Average amount paid per ride
Top City	City with highest revenue

This project demonstrates SQL querying, business intelligence reporting, dashboard development, and analytical thinking skills suitable for Data Analyst roles.
